

Quality Minded — Meetup #1, Part 2

Open Source: the platform we use

Why an agents platform?

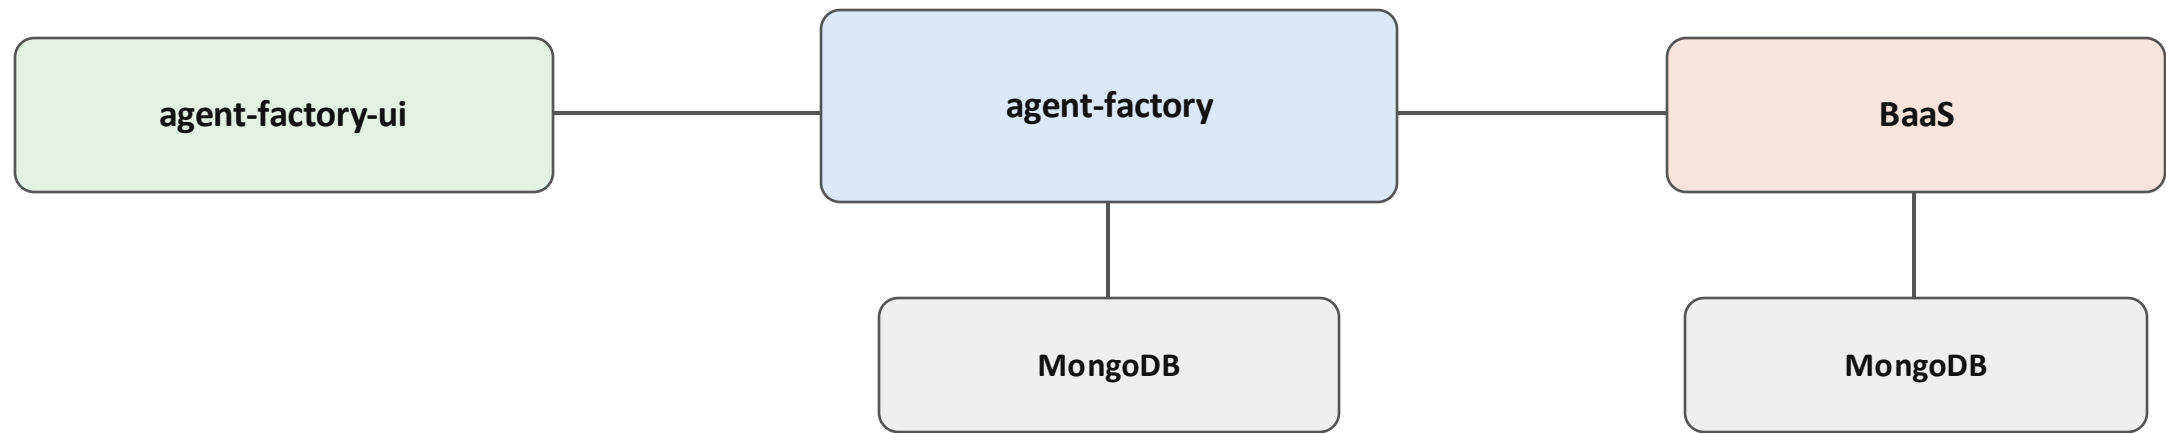

A few things we kept hitting:

- We need to create, edit and update agents fast.
- We need a way to share agents — with the team, with the community.
- We need to call agents directly from CI/CD pipelines, not just from a chat window.

Core components

- Each piece can run locally or in Docker.
- agent-factory — the platform itself: create, maintain and run agents. Runs on MongoDB out of the box; other databases can be plugged in.
- agent-factory-ui — web UI, because at some point we got tired of driving everything with raw API calls and JSON from a terminal.
- BaaS (Browser as a Service) — a service to talk to a real browser. Unlike Selenium-style tools, it has LLM integration, so you can mix classic selectors with natural-language ones:
 - `click("button.btn_profile.btn.btn-outline-theme")`
 - `llmClick("grey arrow near my account button")`

How it fits together

Demo

The most interesting part:

Dmitry's demo.

Repos

The most important part — the links.

- **Agentic platform** — <https://github.com/Ursa-Minor-Beta/agent-factory>
- **Web UI (optional)** — <https://github.com/Ursa-Minor-Beta/agent-factory-ui>
- **BaaS — browser service** — <https://github.com/Ursa-Minor-Beta/baas>
- **BaaS Go client** — <https://github.com/Ursa-Minor-Beta/baas-client> — for using BaaS from old-style autotests.

What to do with all this

- **First steps**

- If you have time, try to set up agent-factory locally and play with it for your daily QA tasks.
- If your testing routine includes browser testing, try agent-factory + BaaS together.
- Leave feedback here: <https://forms.gle/mqvcDPjR5sFijH4k6> . Even if you think it's useless — trust me, it's not. Tried and didn't like it, got stuck, failed to set up, or just not useful — I want to hear from you. That's how we decide whether to keep going.

- **Next step**

- Over the next week I'll add my "be a user" and "demo" agents to the repo. If you have a web app to test, try both and tell me which one works better.
- Feel free to modify the agents to fit your own setup.
- Need a new agent but not sure how to build it? Leave a sign here: [Agent request form](#)

- **How to contribute**

- Take an existing issue from GitHub and open a PR.
- Open a new issue and send a PR for it yourself.
- I'll do my best to give a detailed code review, fast. Either we merge, or you get review notes you can share at your next interview.

Questions?

- Ask now or later in our group <https://www.meetup.com/quality-minded>
- Contact: ekaterina.tuna.v@gmail.com

Thank you

Questions, ideas, war stories — all welcome.
